

Flash21

Flash21 is Astaris Canada Ltd.'s new fuel gelling agent and is distributed in the U.S. by Type One Incident Support Inc. This product is a two-part liquid gelling agent solution which provides a fast, reliable gelling time. This product reaches a desirable viscosity that does not settle in the fuel. Flash21 is designed to be added to fuel as two parts, an A and a B—one liter of each. One box of Flash21 has 12 liters of product, six of Flash21 A and six of Flash21 B. One liter of A and one liter of B will gel 55 U.S. gallons of fuel.

Flash21 can be mixed with various fuels including straight gas, diesel, Jet A or Jet B if available. Using Jet A alone will produce a good gel but because of the low flash point of this type of fuel, you may need to add 20-30% straight gas to produce a better ignition point.

Flash21 was developed to allow users to mix this product with fuel regardless of temperature, ensuring a consistent gelled fuel mixture. Flash21 gelled fuel will not lose viscosity, allowing use of gel during the entire burning operation. This product mixes and disperses throughout the fuel with no lumping and sets up quickly. For additional information on safety and handling, please refer to the product labels and Material Safety Data Sheets which are available for both products.

Applications for Flash21 can be used in conjunction with a Terra Torch
